

Angel Oak Multi-Strategy Income Fund Quarterly Review

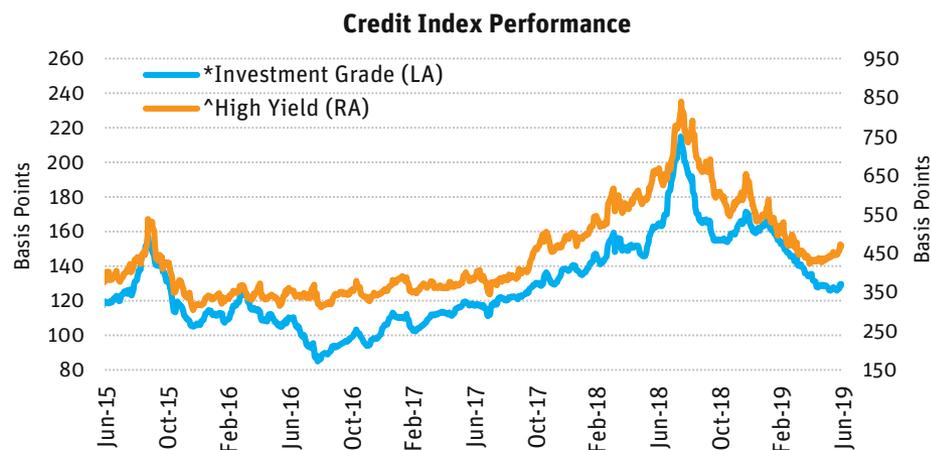

June 30, 2019

Quarter in Review

- U.S. risk assets were volatile in the second quarter as trade tensions with China and Mexico dominated the headlines; however, a more dovish Federal Open Market Committee (FOMC) sparked a rally in equities and credit in the last month of the quarter. The S&P 500 was up 4.30% while the NASDAQ Composite Index increased 3.88% in the second quarter. Corporate spreads benefited with the broader rally in risk assets.
- Following the sharp credit softness in the fourth quarter of 2018, FOMC Chairman Powell took a step back from his more hawkish sentiment, which created four rate hikes in 2018. The Fed reversal ignited a sharp rally in global assets for the first half of 2019. According to Bank of America Merrill Lynch Research, global stocks were up 15.5%, commodities rose 16.2%, HY corporates increased 9.3%, and IG corporates were up 7.7%. Falling interest rates throughout the first half of 2019 benefited both equities and U.S. fixed income. For Q2, the Bloomberg Barclays IG Corporate Index tightened 4 basis points to 115 OAS, while the HY equivalent tightened by 15 basis points to 371 OAS. U.S. Treasury yields fell across the curve, bull steepening the 2s10s spread by 11 basis points to 0.25%. The 10-year Treasury yield decreased 41 basis points to finish the quarter at 2.00%. 1M LIBOR fell 9 basis points to 2.40% while 3M LIBOR decreased 28 basis points to 2.32%.
- Structured credit returns were positive in the second quarter, especially for lower-rated tranches as long-duration assets benefited from the rate rally. Legacy non-agency residential mortgage-backed securities (RMBS) posted positive returns of approximately 2.7% in the second quarter, with positive excess returns for Alt-A and Option Arm of 2.0% and 2.2%, respectively. U.S. collateralized loan obligations (CLOs) were up 1.5% across the capital stack in the second quarter. CLOs generated positive excess returns of 0.7% to 1.1% for A and higher-rated tranches and 1.7%/2.3% for BBB/BB-rated tranches. Commercial mortgage-backed securities (CMBS) benefited from tighter spreads, posting positive excess returns of 0.5% for AA- through BBB-rated tranches. The asset-backed securities (ABS) sector posted a positive return of 1.6% for the quarter driven primarily by rates as the sector posted a 0.0% excess return. While most structured spread sectors posted positive returns year-to-date, Credit risk transfer (CRT) B1 and CLO BB generated the highest positive excess returns year to date at 7.4% and 7.1%, respectively.
- The FOMC looks to be following the rates market as the leadership is now signaling a potential rate cut in the third quarter, citing “global growth concerns” as the reason to “sustain” the expansion. The bond market is now pricing in 75 basis points of cuts by year-end and Fed Funds futures are implying an 80% probability of one cut and a 20% probability of two cuts in the July meeting. Inflation is currently running below the FOMC’s long-term target, creating more room to cut rates. CORE PCE registered 1.6% year-over-year through June, 0.1% above market expectations of 1.5%.
- The U.S. labor market continues to remain healthy. Nonfarm payrolls rose 224k in June and have averaged +166k during the second quarter. The unemployment rate is currently running at 3.7%, with average hourly earnings continuing to rise at approximately 3.1% year-over-year.
- On the housing front, the S&P CoreLogic 20 City Index rose 2.54% through April. Housing starts fell 0.9% month-over-month in May to an annualized pace of 1.269MM. While new home sales declined 7.8% month-over-month, existing home sales increased 2.5% month-over-month.

Benchmark Performance	6/30/19	3/31/19	Quarterly Change (bps)
1-Month LIBOR	2.40	2.49	-0.09

Portfolio Performance

Summary

The Fund was up 1.61% in the second quarter, underperforming the benchmark by 1.47%, which was up 3.08%. For 2019, the Fund is up 2.93% through June, underperforming the benchmark by 3.18%, as the Bloomberg Barclays U.S. Aggregate Bond Index was up 6.11% over the same period.

Primary contributors to Q2 performance were:

- Positive total returns in RMBS, CMBS, CLOs, and ABS.
- High allocation to RMBS, including legacy sectors of option adjustable-rate mortgages (ARM) and hybrid ARM
- Increasing allocation to new issue RMBS sectors including non-performing loans, reperforming loans (RPL), non-QM
- Positive income returns north of the benchmark

Primary detractors were:

- Interest rate duration positioning short of the benchmark
- Focus on floating-rate bonds given the decline in 1M and 3M LIBOR rates

Net Total Returns as of 6/30/19	3 Mo.	YTD	1 Yr.	Annualized		
				3 Yr.	5 Yr.	SI ¹
Class I	1.61%	2.93%	3.96%	5.63%	3.88%	7.00%

*Estimated returns, net of hedges, and unaudited. Attribution is calculated using an internal model, thus, returns may vary from the Fund's total return.

RMBS

- NA RMBS had a total return of 53 basis points in June, contributing 32 basis points to Fund performance. Throughout the second quarter, the sector generated a total return of 208 basis points, contributing 131 basis to Fund performance. Spreads across the sector were unchanged on the month. The duration rally helped pull prices higher in the new issue universe. We expect to see the impact of the rate rally filter through legacy in the form of increased voluntary prepayment speeds in the coming months.
- After a slow May, the new-issue market picked back up in June with almost \$13 billion coming to market across 27 deals. RPL and CRT dominated the new issue landscape accounting for 68% of the issuance. Non-QM had the third largest share contributing approximately 15% to issuance. Two first-time issuers priced deals during the month, including one in Non-QM.

CMBS

- CMBS returned 239 basis points in the second quarter, contributing 15 basis points to Fund performance net of hedges. Year-to-date, CMBS returned 449 basis points to Fund performance, contributing 29 basis points net of hedges. Generic spreads for the quarter were mixed across the credit structure. For example, AAAs and BBBs tightened by 3 and 15 basis points to 85 and 330 basis points, respectively while AA widened by 5 basis points to 135, and single A remained flat at 175. In new issue, \$27.6 billion priced for the quarter, split between \$9.6 billion of conduit, \$12.6 billion of single asset/single borrower (SASB), and \$5.4 billion of commercial real estate CLOs. Allocation within CMBS decreased slightly to 9.8% in the second quarter from 10.1% in the previous quarter. Over the quarter, the Fund's allocation to floating rate AAA securities coupled with SASB allocation has increased while reducing Conduit and Agency Mezz.

CLOs

- CLOs had a total return of 19 basis points in June, contributing 1 basis point to the Fund, bringing the year-to-date total return to 415 basis points, contributing 37 basis points to the Fund. The focus remained on defensive-natured, seasoned bonds closer to the reinvestment period end date as opposed to the standard five-year reinvest/two-year non-call structure. The Fund has also looked to target discount bonds with upside from potential corporate action.

ABS

- The ABS allocation produced a total return of 42 basis points in June, contributing 2 basis points to the Fund, bringing the year-to-date total return to 327 basis points, contributing 12 basis points to the Fund. The Fund continued to focus on short, relatively attractive auto ABS higher up in the capital structure. Spreads were wider across the capital structure for both autos and cards. Fixed-rate paper rallied as the curve remained flat and projections for rate cuts became greater.

Definitions

Basis Point (bps): One hundredth of one percent and is used to denote the percentage change in a financial instrument.

Bloomberg Barclays U.S. Aggregate Bond Index: An unmanaged index that measures the performance of the investment-grade universe of bonds issued in the United States. The index includes institutionally traded U.S. Treasury, government sponsored, mortgage and corporate securities.

Bloomberg Barclays U.S. Corporate High Yield Bond Index: An unmanaged market value-weighted index that covers the universe of fixed rate, non-investment grade debt.

Bloomberg Barclays U.S. Corporate Investment Grade Index: An index that measures the investment grade, fixed-rate, taxable corporate bond market. It includes USD-denominated securities publicly issued by U.S. and non-U.S. industrial, utility and financial issuers.

Core PCE Price Index: An index that is defined as personal consumption expenditures (PCE) prices excluding food and energy prices. The core PCE price index measures the prices paid by consumers for goods and services without the volatility caused by movements in food and energy prices to reveal underlying inflation trends.

Correlation: A statistical measure of how two securities move in relation to another. Index used for comparison is the Bloomberg Barclays U.S. Aggregate Bond Index.

Effective Duration: Measures a portfolio's sensitivity to changes in interest rates. Generally, the longer the effective duration, the greater the price change relative to interest rate movements.

LIBOR: A benchmark rate that some of the world's leading banks charge each other for short-term loans. It stands for Intercontinental Exchange London Interbank Offered Rate and serves as the first step to calculating interest rates on various loans throughout the world.

NASDAQ Composite Index: A broad-based capitalization-weighted index of stocks in all three NASDAQ tiers: Global Select, Global Market and Capital Market.

Option-Adjusted Spread (OAS): The yield spread which has to be added to a benchmark yield curve to discount a security's payments to match its market price, using a dynamic pricing model that accounts for embedded options.

S&P CoreLogic Case-Shiller 20-City Composite Home Price Index: The Index seeks to measure the value of residential real estate in 20 major U.S. metropolitan areas.

S&P 500 Total Return Index: An American stock market index based on the market capitalizations of 500 large companies having common stock listed on the NYSE or NASDAQ.

Sharpe Ratio: A statistical measure that uses standard deviation and excess return to determine reward per unit of risk. A higher Sharpe ratio implies a better historical risk-adjusted performance. The Sharpe ratio has been calculated since inception using the 3-month Treasury bill for the risk-free rate of return.

Spread: The difference in yield between LIBOR and a debt security with the same maturity but of lesser quality.

Standard Deviation: A statistical measure of portfolio risk used to measure variability of total return around an average, over a specified period of time. The greater the standard deviation over the period, the wider the variability or range of returns and hence, the greater the fund's volatility—calculated since inception.

Tranche: A portion of debt or structured financing. Each portion, or tranche, is one of several related securities offered at the same time but with different risks, rewards, and maturities.

Disclosures

Mutual fund investing involves risk; principal loss is possible. Investments in debt securities typically decrease when interest rates rise. This risk is usually greater for longer-term debt securities. Investments in lower-rated and nonrated securities present a greater risk of loss to principal and interest than higher-rated securities do. Investments in asset-backed and mortgage-backed securities include additional risks that investors should be aware of, including credit risk, prepayment risk, possible illiquidity, and default, as well as increased susceptibility to adverse economic developments. Derivatives involve risks different from—and in certain cases, greater than—the risks presented by more traditional investments. Derivatives may involve certain costs and risks such as illiquidity, interest rate, market, credit, management, and the risk that a position could not be closed when most advantageous. Investing in derivatives could lead to losses that are greater than the amount invested. The Fund may make short sales of securities, which involves the risk that losses may exceed the original amount invested. The Fund may use leverage, which may exaggerate the effect of any increase or decrease in the value of securities in the Fund's portfolio or higher and duplicative expenses when it invests in mutual funds, ETFs, and other investment companies. For more information on these risks and other risks of the Fund, please see the Prospectus.

It is not possible to invest directly in an index.
